

Regression Model Development and Computational Procedures to Support Estimation of Real-Time Concentrations and Loads of Selected Constituents in Two Tributaries to Lake Houston Near Houston, Texas, 2005-9: Usgs Scientific Report 2012-5006

Filesize: 7.6 MB

Reviews

Basically no phrases to describe. I was able to comprehend everything out of this published ebook. You can expect to like the way the author compose this ebook.
(Mrs. Novella Will)

REGRESSION MODEL DEVELOPMENT AND COMPUTATIONAL PROCEDURES TO SUPPORT ESTIMATION OF REAL-TIME CONCENTRATIONS AND LOADS OF SELECTED CONSTITUENTS IN TWO TRIBUTARIES TO LAKE HOUSTON NEAR HOUSTON, TEXAS, 2005-9: USGS SCIENTIFIC REPORT 2012-5006

BiblioGov. Paperback. Book Condition: New. This item is printed on demand. Paperback. 50 pages. Dimensions: 9.7in. x 7.4in. x 0.1in. In December 2005, the U. S. Geological Survey (USGS), in cooperation with the City of Houston, Texas, began collecting discrete water-quality samples for nutrients, total organic carbon, bacteria (*Escherichia coli* and total coliform), atrazine, and suspended sediment at two USGS streamflow-gaging stations that represent watersheds contributing to Lake Houston (08068500 Spring Creek near Spring, Tex. , and 08070200 East Fork San Jacinto River near New Caney, Tex.). Data from the discrete water-quality samples collected during 2005-9, in conjunction with continuously monitored real-time data that included streamflow and other physical water-quality properties (specific conductance, pH, water temperature, turbidity, and dissolved oxygen), were used to develop regression models for the estimation of concentrations of water-quality constituents of substantial source watersheds to Lake Houston. The potential explanatory variables included discharge (streamflow), specific conductance, pH, water temperature, turbidity, dissolved oxygen, and time (to account for seasonal variations inherent in some water-quality data). The response variables (the selected constituents) at each site were nitrite plus nitrate nitrogen, total phosphorus, total organic carbon, *E. coli*, atrazine, and suspended sediment. The explanatory variables provide easily measured quantities to serve as potential surrogate variables to estimate concentrations of the selected constituents through statistical regression. Statistical regression also facilitates accompanying estimates of uncertainty in the form of prediction intervals. Each regression model potentially can be used to estimate concentrations of a given constituent in real time. Among other regression diagnostics, the diagnostics used as indicators of general model reliability and reported herein include the adjusted R-squared, the residual standard error, residual plots, and p-values. Adjusted R-squared values for the Spring Creek models ranged from . 582-. 922 (dimensionless). The residual standard errors ranged from . 073-. 447 (base-10 logarithm)....
